EXPERIENCE

Frontend Developer Intern — SmallFare

Apr 2026 – Jul 2026

- Implemented SSR and SSG using Next.js, improving page load performance
- Optimized data fetching with caching and incremental rendering, reducing API calls and improving scalability for large datasets
- Built reusable, modular React components with pagination for dynamic REST API content

Tech Stack: Next.js, React.js, JavaScript, TypeScript, Git, REST APIs

TECHNICAL SKILLS

Languages: C, C++, JavaScript (ES6), TypeScript

Backend: Node.js, Express.js, Redis, BullMQ, JWT (rotation & blacklisting), Google OAuth 2.0

Databases: MongoDB, PostgreSQL (Prisma)

Frontend: React.js, Next.js (SSR/SSG/ISR), React Query (Infinite Queries), Tailwind CSS

Testing: Backend Testing (API & integration tests), Debugging & QA for auth and payment flows

DevOps: GitHub Actions (CI/CD), Vercel Deployment

Core Strengths: Secure Authentication Systems • Testing & QA • Rate Limiting & Caching • AI Content Moderation Pipelines • Role-Based Dashboards • Payment Gateway Integration • Background Job Processing

PROJECTS

Veyra — The Home for Modern Creators

Tech Stack: Next.js, TypeScript, React Query, Node.js, Express.js, MongoDB, Redis, LLM APIs, Razorpay

- Built a full-stack blogging platform with creator dashboards showing followers, likes, blogs, drafts, and comments in real time
- Built AI-powered blog generation and AI summarization features (Groq AI), with a manual editor fallback and tiered free/paid usage limits
- Engineered a two-layer comment moderation pipeline — a JS rule-based filter for spam/gibberish detection escalating to an AI moderation layer, with high-risk comments routed to author review queues
- Designed secure authentication with Google OAuth, OTP login, JWT access/refresh token rotation, and Redis-based token blacklisting
- Implemented Redis-backed rate limiting to prevent OTP/AI abuse, with a rolling 12-hour reset on per-user AI usage limits
- Integrated Razorpay subscriptions with signature verification (order ID + payment ID) to unlock higher AI usage tiers
- Built a SuperAdmin panel to toggle AI features, set global/per-plan limits, adjust burst rate limits, and update plan pricing dynamically — with full audit logs and config snapshots
- Optimized frontend using React Query caching and React Infinite Query for pagination; deployed on Vercel with smooth, lag-free navigation

EDUCATION

B.Tech – Computer Science Engineering, KIET Group of Institutions, Ghaziabad	CGPA: 8.04/10
Class XII – Rajasthan Board	92.40%
Class X – Rajasthan Board	90%

ACHIEVEMENTS

- Solved 250+ Data Structures & Algorithms problems on LeetCode — strong command over arrays, trees, graphs
- Designed a multi-layer AI + rule-based content moderation system reducing manual review workload
- Implemented enterprise-grade security patterns (OAuth 2.0, JWT rotation, Redis token blacklisting, dynamic rate limiting) in production-style personal projects
